

40 Years of Matchbooks

“I hold on to them because they’re beautiful and because the matchboxes change overtime”

Singer Sewing Machine

“It still works and I can still use it, why would I throw it away?”

Turtle Collection From Around the World

“They’re artistic to look at, all are same animal but created in different shape sizes patterns, all interpreted differently”

Cast Aluminum Calderos (large cooking pots)

“They look as good as when I bought them because I take the time and clean them and care for them. No new pots are as good as these.”

Emotional Attachment & Identity:

One pattern that emerged through these interviews was the emotional significance people tend to attach to these objects. Objects tied to significant life moments serve as reminders of those experiences and proof that they happened. These are often objects that tie into an individual's sense of identity – who they were, are, or hope to someday become.

Durability:

There are certain objects we spoke about, Michelle's grandmothers calderos for example, whose continued function after decades overrides any desire to replace it. Getting rid of the objects feels wasteful, disrespectful, and unnecessary. The fact that the item has lasted so long positions the object as reliable and irreplaceable, and only more reason to keep it.

Future Utility:

Some keep objects because of a "I'll need it someday" mentality regarding their possessions. People believe that the object will eventually be needed or repurposed, keeping the idea of disposing of the item perpetually deferred.

Sneakers

Why redesign the sneaker?

- ➔ Sustainability: Shoe consumption in the US reaches upwards of **2.68 billion pairs annually** (Packlane, 2022). The most popular type of shoe being the sneaker; which lasts an average of 12 - 18 months before being discarded... not because the whole shoe fails, but because one part does
- ➔ Economics: The average American spends **\$300–500** per year replacing shoes they didn't want to stop wearing. Replacing a \$20 outsole is far cheaper than buying a new \$150 pair
- ➔ Trend Evolution: Fashion is an **ever-evolving** industry. New sneaker designs appear constantly, positioning sneakers as temporary rather than long-term commitments. Consumers need a solution that allows them to update the look of their sneaker without having to replace the whole thing

Why redesign the experience?

- ➔ Customization, flexibility, and personalization
- ➔ Consume what is produced
- ➔ Today's sneaker shopping experience offers you one choice: **pick a shoe and live with it**
- ➔ Most sneaker stores resemble warehouses with nice lighting and limited choices

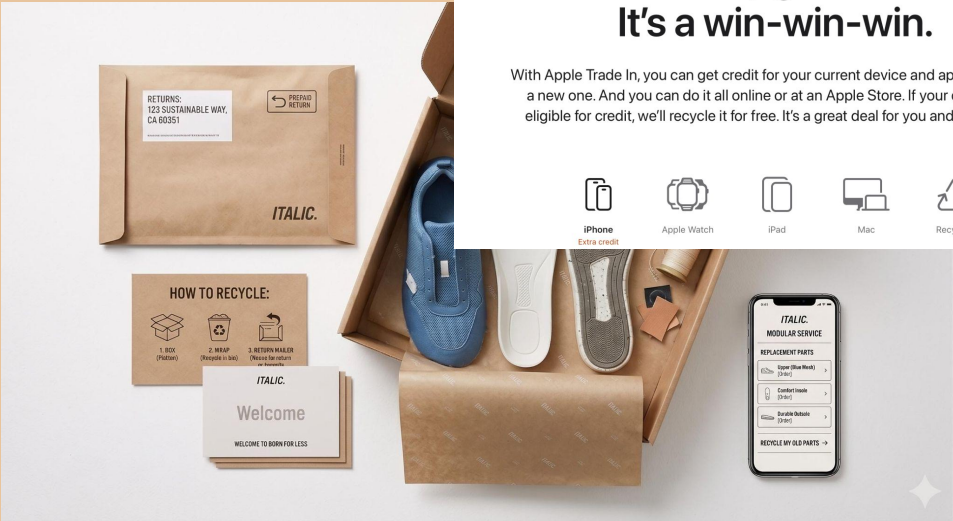

The Sneaker Shopping Experience

SLIDE 4: YOUR REDESIGN

Our redesign is the **modular sneaker**. Consumers can exchange parts when they degrade or when they would like to change the style. The consumer starts by “**building**” their **custom shoe** in-store or online. New parts can be purchased or ordered online.

Parts can be kept and stored by the consumer and **interchanged** when they would like a new style. Consumers may also mail-in or trade parts in-store to be recycled and reused in exchange for store credit toward their next purchase.

Principle Transfer Statement

Chapman — Emotionally Durable Design	Sennett — The Craftsman	Patagonia — Durability Is The Desirability
The principle we transferred from Chapman’s theory of emotionally durable design is that objects should grow and evolve with the owner over time. We applied this as a sneaker redesign that uses modular technology, so consumers may exchange parts only when they degrade or purchase new designs of upgraded parts instead of purchasing a whole new pair of sneakers. We understand that consumers likes and dislikes change over time, with this redesign our sneakers can change with them.	The principle we transferred from Sennett’s theory of repair as a form of understanding, applied as a fully customizable product that allows consumers to construct their own ideal shoe. This positions the consumer as their own shoe craftsman. They are in control and may add whichever aspects of the design that suit their needs and desires, and replace them once they don’t.	The principle we transferred from Patagonia’s case study on the desirability of an objects durability, applied as the modular and interchangeable aspects of a modular sneaker. As trends evolve and sneakers wear down with usage, a consumer may simply order new uppers, insoles, outsoles, etc. Consumers are not required to spend hundreds of dollars replacing shoes simply because they fell out style or one piece fails. aka → Reduce high recurring costs
